The "Magnolia" has great merits. It has also fatal defects. In its mighty chaos of fables and blunders and misrepresentations are of course lodged many single facts of the utmost value. M. C. Tyler, Hist. Amer. Lit., II, 88

—Syn. *error*, *Mistake*, *blunder*, *bull*. An error is a wandering from truth, primarily in impression, judgment, or calculation, and, by extension of the idea, in conduct, it may be a state. A mistake is a false judgment or choice, it does not as error something done, imply moral obliquity, the defect being placed wholly in the wisdom of the actor, and in its treatment of this defect the word is altogether gentle. Blunder is a strong word for a mistake which is stupid, a gross error in action or speech. A bull is a blunder in language, involving generally a very obvious and comical contradiction, but the word is sometimes applied to any particularly inept or ludicrously inappropriate remark

Bobolink (*Dolichonyx oryzivorus*)

spring. The male is about 7½ inches long, black, with a buff nape, and much white or pale ash on the back and wings; the tail feathers are very acute. The female is smaller, yellowish, darker above, and streaked. The

male wears the black livery only in the breeding season, and is only then in song. He molts in midsummer or in August, acquiring a plumage like that of the female. Both sexes are then known as *reed birds* in the Middle States, as *rice birds* in the Southern States, and as *butter birds* in Jamaica. In the spring the male acquires his black and buff suit without molting any feathers, whence the correct popular notion, based however on erroneous premises, that the reed birds turn into bobolinks in the spring. The bird is abundant in most of the United States, and is a regular migrant, breeding on the ground in meadows in the Northern States and Canada. In the fall when fat and flocking in the marshes to feed upon wild oats (*Zizania*), it is much esteemed for the table. Also called *bob lincoln*, facetiously *Robert of Lincoln* (see *bob lincoln*), *skunk blackbird*, from its coloring which resembles that of the skunk, and *meadowink*.

The

most remarkable boiling springs are the *geysers*, which throw up columns of water and steam, but there are many others in various parts of the world, often associated with *geysers*, characterized only by ebullition and emission of steam. Some of the latter, as in California and New Zealand, are strongly impregnated with mineral matters and variously colored, while others are charged with liquid mud. See *geyser*

**boilingly** (boi'ling-li), *adv* In a boiling manner.

**boiling-point** (boi'ling-point), *n* The temperature at which a liquid is converted into vapor with ebullition, more strictly, the temperature at which the tension of the vapor is equal to the pressure of the atmosphere. This point varies for different liquids, and for the same liquid at different pressures, being higher when the pressure is increased, and lower when it is diminished. Under the normal atmospheric pressure (see *atmosphere*) water boils at 212° F (100° C, 80° R), and it is found that the boiling point varies 88 of a degree F for a variation in the barometer of half an inch. Hence water will boil at a lower temperature at the top of a mountain than at the bottom, owing to diminution in the pressure, a fact which leads to a method of measuring the height of a mountain by observing the temperature at which water boils at the bottom of the mountain and at the top. At the top of Mont Blanc water boils at 185° F. Under a pressure of about  $\frac{1}{10}$  of an atmosphere water would boil at 40° F, while under a pressure of 10 atmospheres the boiling point would be raised to 356° F. A liquid may be heated much above its true boiling point without boiling, but the superheated vapor immediately expands until its temperature is reduced to the boiling point. Hence, in determinations of the boiling point, the thermometer is never immersed in the liquid, but in the vapor just above it. — **Kopp's law of boiling-points**, the proposition that in certain homologous series of chemical substances each addition of CH<sub>2</sub> is accompanied by a rise in the boiling-point of about 19.5 C

A Linnean genus of lepidopterous insects, now the type of the family *Bombycidae*. The caterpillar of the *Bombyx mori* is well known by the name of *silk worm*. When full grown it is 3 inches long, whitish gray, smooth, with a horn on the penultimate segment of the body. It feeds on the leaves of the mulberry (in the United States also on those of the Osage orange), and spins an oval cocoon of the size of a pigeon's egg, of a close tissue, with very fine silk, usually of a yellow color, but sometimes white. Each silk fiber is double, and is spun from a viscid substance contained in two tubular organs ending in a spinneret at the mouth. A single fiber is often 1,100 feet long. It requires 1,600 worms to produce 1 pound of silk. Greek missionaries first brought the eggs of the silkworm from China to Constantinople in the reign of Justinian (A. D. 527-565). In the twelfth century the cultivation of silk was introduced into the kingdom of Naples from the Moors, and several centuries afterward into France. The silkworm undergoes a variety of changes during the short period of its life. When hatched it appears as a black worm, after it has finished its cocoon it becomes a chrysalis, and finally a perfect cream-colored insect or moth, with four wings. For other silk spinning *bombycids*, see *silkworm*. See cut in next column.

consisting of branching cells lying in an intercellular substance made hard with earthy salts (consisting of calcium phosphate with small amounts of calcium carbonate and magnesium phosphate, etc.), and forming the substance of the skeleton or hard framework of the body of most vertebrate animals. When the earthy salts are removed, the remaining intercellular substance is of cartilaginous consistency, and is called ossein or bone cartilage.

Through the substance of *bone* are scattered minute cavities—the lacunae, which send out multitudinous ramifications, the canaliculi. The canaliculi of different lacunae unite together, and thus establish a communication between the different lacunae. If the earthy matter be extracted by dilute acids, a nucleus may be found in each lacuna, and, not infrequently, the intermediate substance appears minutely fibrillated. In a dry bone, the lacunae are usually filled with air. When a thin section of such a bone is covered with water and a thin glass, and placed under the microscope, the air in the lacunae refracts the light which passes through them in such a manner as to prevent its reaching the eye, and they appear black. All bones, except the smallest, are traversed by small canals, converted by side branches into a net work, and containing vessels supported by more or less connective tissue and fatty matter. These are called *Haversian canals*. *Huaseley and Youmans*, *Physiol.*, § 350

**2.** One of the parts which make up the skeleton or framework of vertebrate animals, as, a bone of the leg or head. Bones of cattle and other animals are extensively used in the arts in forming knife handles, buttons, combs, etc., in making size, gelatin, lampblack, and animal charcoal, and for various other purposes. They are also extensively employed as a ma-

nure for dry soils, with the very best effect, being ground to dust, bruised, or broken into small fragments in mills, or dissolved in sulphuric acid. The great utility of bones as a manure arises from the phosphate of lime they supply to the soil.

D. 600, refers to the writing of runes on tablets of ash, cf L. *liber*, book, bark, Gr. *βιβλος*, book, *βιβλος*, book, papyrus: see *iber*, *Bible*, *paper*), but AS *bōcestaf*, if lit 'beech-staff,' would hardly come to be applied to a single character inscribed thereon, it is rather 'book-staff,' i. e., a character employed in writing, < *bōc*, a writing, + *staf*, a letter (cf *rūn-staf*, a runic character, *staf-craft*, grammar). The connection with *beech*<sup>1</sup> remains uncertain: see *beech*, *buck*?] 1 *a* writing; a written instrument or document, especially one granting land, a deed. **bookkeeper** (bûk'kê'pér), *n*. One who keeps accounts; one whose occupation is to make a formal balanced record of pecuniary transactions in account-books.

**bookkeeping** (bûk'kê'ping), *n*. The art of recording pecuniary transactions in a regular and systematic manner, the art of keeping accounts in such a manner as to give a permanent record of business transactions from which the true state or history of one's pecuniary affairs or mercantile dealings may at any time be ascertained. Properly kept books show what a merchant has, what he owes, and what is owing to him, as well as what sums he has received and paid, the losses he has incurred, etc. Books are kept according to one of two chief methods, viz, by *single* or by *double entry*. The former is more simple and less perfect than the latter, and is now in use chiefly in retail business. In *bookkeeping by single entry*, three books, a day book, a cash book, and a ledger, are commonly used, but the essential book is the ledger, containing accounts under the names of the persons with whom a trader deals, goods or money received from any one of them being entered on one side of the account, called the credit side, and goods sold or money paid to that person being entered on the opposite or debit side of the account. In *bookkeeping by double entry* the ledger accounts are of two kinds, personal accounts such as those just described, and book accounts, in which the commodities dealt in are made the subjects of separate accounts, and have a debit and a credit side, as in personal accounts. Thus, if a trader purchases 100 bales of cotton from A. B. the account in the ledger headed A. B. is credited with 100 bales of cotton, so much, while the account headed C. D. is debited with the same quantity and amount, should the trader sell 10 bales to C. D., the account headed C. D. is debited with 10 bales at so much, and the account headed Cotton is credited with 10 bales, and so on. These book accounts are based on the principle that all money and articles received become debtors to him from whom or to that for which they are received, and, on the other hand, all those who receive money or goods from us become debtors to cash or to the goods. In this way every transaction is entered in the ledger on the creditor side of one account and on the debtor side of another. The books used in double entry vary in number and arrangement according to the nature of the business and the manner of recording the facts. Transactions as they take place from day to day are generally recorded in such books as the stock book, cash book, bill book, invoice book, and sales book, or they may all be recorded in order in a waste book or day book. Upon these books or additional documents are based the journal and ledger. The former contains a periodical abstract of all the transactions recorded in the subordinate books or in documents not entered in these, classified into debits and credits, while the latter contains an abstract of all the entries made in the former, classified under the heads of their respective accounts.

*W. K. Griffin, in N. A. Rev.*, (XX) 288

3 One who makes a book (see *book*, *n*, 9) on a race or other doubtful event, a professional betting man. See *extract*.

In betting there are two parties—one called "layers," as the book makers are termed, and the others "backers," in which class may be included owners of horses as well as the public. The backer takes the odds which the book maker lays against a horse; the former speculating upon the success of the animal, the latter upon its defeat, and taking the case of (remember for the Derby of 1872, just before the race, the book maker) would have laid 8 to 1, or perhaps 1000 to 1, against him, by which transaction, if the horse won, as he did, the backer would win £1000 for taking 8 to 1, and the book maker lose the £1000 which he asked to win the smaller sum. At first sight this may appear an act of very questionable policy on the part of the book maker, but really it is not so, because so far from running a greater risk than the backer he runs less, has much as it is his plan to lay the same amount (£1000) against every horse in the race, and on there can be but one winner, he would in all probability receive more than enough money from the many losers to pay the stated sum of £1000 which the chances at the book had laid against the one winner, whichever it is.

**boom** (bôm), *n.* [A recent American use, originating in the West, and first made familiar in 1878, a particular application of *boom*, *v.*, (d) (with ref. also to *boom*, *n.*, (d)), from the thought of sudden and rapid motion with a roaring and increasing sound. In later use some assume also an allusion to *boom*, *n.*, 3. When a boom of logs breaks, the logs rush with violence down the stream, and are then said to be "booming"; but this appears to be the ordinary *ppr. adj.* *booming*, roaring, rushing with violence, and to have no connection with *boom*, *n.*, or *v.*] *I. intrans.* To go on with a rush, become suddenly active, be "lively," as business; be prosperous or flourishing. [The earliest instance of the word in this sense appears to be in the following passage.]

"The Republicans of every other State are of the same way of thinking. The fact is, the Grant movement (for a third term of the presidency) is booming." *J. B. McCullagh*, in St. Louis Globe Democrat, July 13, 1878.

Mr. McCullagh, in a letter to one of the editors of this Dictionary, says: "I cannot explain how I came to use it, except that, while on the gunboats on the Mississippi river during the war, I used to hear the pilots say of the river, when rising rapidly and overflowing its banks, that it (the river) was 'booming.' The idea I wished to convey was that the Grant movement was rising — swelling, etc. The word seemed to be a good one to the ear, and I kept it up. It was generally adopted about a year afterward. I used it as a noun after a while, and spoke of 'the Grant boom.'"

They all say that one railroad spoils a town, two bring it to par again, and three make it boom. *E. Marston*, Frank's Ranch, p. 36.

**boomerang** (bôm'me-rang), *n.* [Recently also *boomerang*, *boomerang*, *boomerang*, from a native name in New South Wales, *wo-mur-rang* and *bumarin* are cited as aboriginal names of clubs.] 1 A missile weapon of war and the chase, used by the aborigines of

Australia, consisting of a rather flat piece of hard wood bent or curved in its own plane, and from 16 inches to 2 feet long. Generally, but not always, it is flatter on one side than on the other. In some cases the curve from end to end is nearly an arc of a circle, in others it is rather an obtuse angle than a curve, and in a few examples there is a slight reverse curve toward each end. In the hands of a skilful thrower the boomerang can be projected to great distances, and can be made to ricochet almost at will. It can be thrown in a curved path, somewhat as a bowl can be "screwed" or "twisted," and it can be made to return to the thrower, and strike the ground behind him. It is capable of inflicting serious wounds.

Hence — 2. Figuratively, any plan, measure, or project the consequences of which recoil upon the projector, and are therefore the opposite of those intended or expected.

ing chiefly in the leather binding but also riddling the leaves with small holes. The larvæ of both species are closely similar, being cylindrical and curved like those of most beetles, but furnished with well developed legs, and with rather long sparse pubescence. In most styles the leg part keeps its place by its stiffness alone, although in certain fashions it has been laced around the calf. Boots seem to have appeared in Europe about the middle of the fifteenth century. They were not much worn at first, because persons of the wealthier classes, when abroad, were generally clad in armor. At the time of the gradual disappearance of armor very high boots of thick leather came into favor as covering for the legs, and by the sixteenth century they were already in common use. (See *jack boot*.) Late in the eighteenth century boots became a usual part of elegant costume, and were made lighter and more closely fitting. In England boots ceased to be common in elegant costume as early as 1865, and about fifteen years later they began to disappear in the United States, but they are still worn for special purposes and occupations, as by horse men, sailors, etc.

A much milder variety consisted of a boot or buskin made wet and drawn upon the legs and then dried by heat, so as to contract and squeeze the legs.

(d) In *her*, the outer edge of the field when of different tincture from the center. Its width is uniform, and should be one fifth the width of the field. French heralds consider the border as one of the ordinaries. In English heraldry it is sometimes a mark of difference. The border always covers the end of any ordinary, as the chevron fess etc. When a coat of arms is impaled with another, if either of them has a border, it is not carried along the pale, but surrounds the outside of the field only. The border when charged with an ordinary shows only so much of the ordinary as comes naturally upon that part of the field occupied by the border, thus, the cut represents a border paly of six pieces, argent and argent.

The tidal wave being a wave of translation, the shoaling and narrowing of channels where the tide rises very rapidly produce a great increase in the height of the wave. The forward parts of the wave too in shoaling water advance less rapidly than the backward parts, and so cause a great accumulation in front. The most celebrated bores in the old world are those of the Ganges, Indus, and Brahmaputra. The last is said to rise to a height of 12 feet. In the Amazon and other rivers in Brazil the bore reaches a height of from 12 to 16 feet. In England the bore is observed more especially in the Severn, Trent, and Wye, and in the Solway Frith. The bores in some bays at the head of the Bay of Fundy are very remarkable. In some parts of England it is called *caep* (which see) on the Amazon, the *proroca*, on the Seine, the *barre*, and on the Garonne and Dordogne in France, the *marée*.

When the rise of the tide begins, the surface of the water is disturbed in mid channel, but the water is not broken, it is merely like a common wave. But as this rapid rise elevates the surface suddenly above the level of the flat sands, the water immediately rushes over them with great velocity, and with a broken front, making a great noise. And this is the whole of the bore

It treats of the forms of plants, their structure, the nature of the tissues of which they are composed, the vital phenomena connected with them, the arrangement of them into larger and smaller groups according to their affinities, and the classification of these groups so as to exhibit their mutual relations and their position in the vegetable kingdom as a whole. The science further investigates the nature of the vegetation which at formers epochs lived on the earth, as well as the distribution of plants at the present time. It is thus divided into several sections: (a) *Structural or morphological botany*, that branch of the science of botany which relates to the structure and organization of plants, internal or external, independently of the presence of a vital principle. Also called *anatomy*. (b) *Physiological or biological botany*, that branch which relates to the history of vegetable life, the functions of the various organs of plants, and their minute structure and method of growth. (c) *Descriptive botany*, that branch which relates to the description and nomenclature of plants. Also called *phytography*. (d) *Systematic botany*, that branch which relates to the principles upon which plants are to be classified or arranged with reference to their degrees of relationship. The system of classification now universally adopted is that proposed by Antoine Laurent de Jussieu, and improved and enlarged by DeCandolle, Brown, and others. It is generally called the *natural system* because it is intended to express, as far as possible, the various degrees of relationship among plants as these exist in nature, and to group next to each other the various species, genera, and orders which are most alike in all respects. Several artificial systems have been proposed, as that of Linnæus, based on the modifications of the corolla, but the best known is that of Linnæus founded on the stamens and pistils. This system, which was designed by Linnæus to be only temporary, proved of great value to the science of botany, but it has now gone entirely out of use, or is used only as a partial index to the vegetable kingdom. (e) *Geographical botany*, that branch which relates to the natural distribution of plants over the globe, and to the inquiry into the causes which have influenced or maintain this distribution. (f) *Paleontological or fossil botany*, that branch which embraces the study of the forms and structures of the plants found in a fossil state in the various strata of which the earth is composed.

=*Syn* *Boundary* *Bound*, *Border* *Confine*, *Frontier* A *boundary*, in its strict sense, is a visible mark indicating a dividing line between two things, or it is that line itself, it marks off a given thing from other things like in kind, as one field or country from another. A *bound*, on the other hand, is the limit or furthest point of extension of one given thing, that which limits it not being specially considered, it can be used of that which is not limited by anything like in kind as, the *boundaries* of a field, but the *bounds* of space, the *boundaries* of a science, but the *bounds* of knowledge. Hence the figurative uses of *bound* as, "I believe I speak within *bounds*," where *boundaries* would be absurd. Thus, the *bounds* of a parish may be defined by certain marks or *boundaries*, as heaps of stones, dikes, hedges, streams, etc., separating it from the adjoining parishes. But the two words are often interchangeable. A *border* is a belt or band of territory lying along a *bound* or *boundary*. A *confine* is the region at or near the edge and generally a narrower margin than a *border*. A *frontier* is a border viewed as a front or place of entrance as, he was met at the *frontier*. The word is used most in connection with military operations as, their *frontiers* were well protected by fortresses

**Bovidae** (bō'vi-dē), *n pl* [NL, < *Bos* (Bov-), ox, + *-idae*] A family of hollow-horned ruminants, the ox tribe, containing the bovines. The family was formerly nearly coextensive with the genus *Bos* in a large sense, including cattle as distinguished from goats, sheep, and antelopes. In this acceptance the family corresponds to the modern subfamily *Bovina*. It has been found impossible, however, to draw any sharp dividing line between cattle and other hollow-horned ruminants, among some of which, as the antelopes, connecting links occur. Therefore, notwithstanding the familiar difference between an ox and a sheep, for example, or a goat and an antelope, the family *Bovidae* now contains all of those which have hollow, persistent horns, common to both sexes, generally two, sometimes four, and certain common cranial characters by which they collectively differ from the *saiga* on the one hand and from the pronghorn on the other, these two so-called antelopes being made respectively the types of the families *Sagidae* and *Antilocapridæ*. The *Bovidae* as thus defined are conventionally divided into five subfamilies: *Bovina*, cattle, *Omobovina*, muskoxen, *Ovis*, sheep, *Caprina*, goats, and *Antilopina*, antelopes. See these words

The head is carried low upon a short neck, the legs are relatively short, with the canon bones little or no longer than the phalanges, the hoofs broad, the muffs naked, the horns simple and unbranched, and the tail tufted at the end. There are four inguinal teats. The leading genera are *Bos*, *Bubalus*, *Anoa*, *Buon*, and *Poephagus*, or oxen, buffaloes, bisons, and yaks

**bovine** (bō'vin or -vīn), *a* and *n* [= F *bovine* = Fr *bovin*, < L *l. bovinus*, < L *bos* (bov-), ox] I. *a* 1 Pertaining or belonging to oxen, or specifically to the *Bovina*, boviniform. Hence — 2 Ox-like, stolid, inert, dull

**2 A weapon consisting of a strong strip of elastic wood or other elastic material, with a string stretched between its ends, used for shooting arrows** When the bow has been bent to its full extent by pulling the string back from it the recoil of the string (against the inner side of which the notch of the arrow is placed) when released impels the arrow. The bow and arrow have been used in all ages and by many peoples as a weapon, and, though superseded in the advance of civilization by firearms are still in use among savage tribes, and are officially recognized weapon of the Manchu garrisons of China, where archery is still one of the subjects of examination for officers in the regular army. Bows were at one time divided into *longbows* and *cross bows*. During the middle ages the nations of Europe used longbows of 5 or 6 feet in length, the shorter ones being used by horsemen, and the longer by the foot archers. The bows now commonly used in archery are of two kinds, the single piece bow, or self bow, and the back or union bow. The single piece bow is made of one rod of hickory, lance wood, or yew, the last, if perfectly free from knots, being considered the most suitable wood. The union bow is made of two or sometimes three pieces joined together. See cuts under *archer*, *bowman*, and *crossbow*

These, being rubbed with resin and drawn over the strings of the instrument, cause it to sound. (b) An implement consisting of a piece of wood curved, and having a string extended from one extremity to the other, used (1) by smiths in turning a drill, (2) by turners in turning wood, and (3) by haters in preparing fur and wool for their use

Unknown in the older sacred literature, Brahman becomes by degrees an object of adoration to the Brahmans and is officially combined into a trinity or trinity with Vishnu and Shiva being regarded as Creator, while Vishnu is Preserver and Shiva is Destroyer. Brahman was never worshiped by the people, and only one temple sacred to him is known. From being in the beginning individuals and families distinguished for wisdom, sanctity, and poetic power, they gradually consolidated their influence and became a strictly hereditary class holding in their hands the ministry of holy things, the custody of the scriptures and knowledge of the sacred and learned doctrine, and the performance of the sacrifice. They were held to be created from the mouth of Brahma, to be inviolable, and entitled to the worship of the other castes. Theoretically, the life of a Brahmin was divided into four stages, those of student, householder, anchorite, and ascetic. In later times the relations and occupations of the caste have become much confused, and Brahmins are to be found in every grade of dignity and of very various modes of life. There are many subdivisions of the caste, more or less isolated and refusing intercourse with one another. **Brahmo-Somaj** (brā'mō-sō-māj'), *n* [*< Hind brāhma, Brahma* (prayer), + *samāj*, society, assembly, lit. a worshipping assembly. See *Brahma*, *Brahman*] A monotheistic religion in India, which originated with Rājā Ram Mohun Roy, a Hindu reformer, who died in 1833, and received a new impulse and a new direction under his successor, Keshub Chunder Sen, who died in 1885. The mystical theology of the Brahmo-Somaj can only be proximately stated in the language of the identical philosophy. Its fundamental tenet is the universal presence of the Divine Spirit who pervades all nature and inspires all who are willing to receive him. Man is equipped for this purpose with a faculty of spiritual insight, a faith faculty, called *logos*. Inspiration is a universal fact, and all the great world teachers have been divinely inspired prophets, all the great world religions contain some divine truth, and in all their great sacraments there is some spiritual benefit. It is not clear whether Christ is regarded as simply the greatest of these inspired prophets, or as something more. Some utterances indicate a recognition of his character as divine. The Brahmo-Somaj differs from Deism in teaching the personal communion of the soul with a personal God and from Christianity in not teaching any specific revelation of a remedy for sin. It is an aggressively missionary religion and its preaching has been accompanied by works of practical reformation such as the abolition among its adherents of polygamy of caste and of idolatry in all its forms, the reformation of marriage customs and a temperance reform.

The rounded masses near S are the corpora albicantia, T rests upon the pons Varolii

ley and others the epencephalon of the above nomenclature is called *metencephalon*, and the next segment (the fifth) is then named *myelencephalon*. Common English equivalents of the above five segments are *forebrain*, *twain brain*, *midbrain*, *hindbrain*, and *afterbrain*, these are terms translated directly from the nomenclature of the German anatomists, who call them respectively *vorderhorn*, *zwischenhorn*, *mittelhorn*, *hinterhorn*, and *nachhorn*. Haeckel calls them *protopyche*, *deutopyche*, *mesopyche*, *metapyche*, and *epipyche*. These five segments are fundamentally distinct, and correspond embryologically to as many cerebral vesicles or brain bladders which arise from three primitive vesicles by subdivision. The simplest and a common division of the brain is into the *cerebrum* or *brain proper*, the *cerebellum* or *little brain*, the *pons Varolii*, and the *medulla oblongata* (See cuts under *cerebral* and *corpus*). The human brain is distinguished for the relatively enormous size and surface complexity of the cerebrum or prosencephalon, which completely covers the cerebellum and olfactory lobes, and is marked by many deep fissures or sulci separating gyri or convolutions. The cerebrum is divided into right and left halves, or cerebral hemispheres, connected by the great transverse commissure or corpus callosum. Each hemisphere is divided into three primary lobes, frontal, parietal, and occipital, and many more detailed subdivisions of its surface are recognized. The interior of the brain (which is primitively hollow) is traversed in the adult by a set or system of connected cavities known as *ventricles* or *cavities*. The first and second of these are the right and left ventricles of the hemispheres, or *proventricles*, the third is the *diacoele*, the fourth is the *epicoele*, passages connecting these are the foramina of Monro and the aqueduct of Sylvius. The brain and adjoining portions of the spinal cord give rise to 12 pairs of nerves, called *cranial nerves* because they emerge from foramina in the base of the skull (See *cranial*). Brain substance is of two kinds, gray ganglionic or cellular nerve-tissue, and white commissural or fibrous nerve tissue. The gray matter which invests the cerebrum and cerebellum is also called the *cortical substance*, in distinction from the white or *medullary substance* of the interior. A brain is in fact a collection of gray ganglia united by white commissures. Besides the cortex, there are several ganglia or collections of gray matter in the interior, as the corpora striata, the optic thalami, the optic lobes or corpora quadrigemina, the corpora dentata of the cerebellum, and the corpora olivaria of the medulla oblongata. Connected with the brain are two non nervous structures, the conarium or epiphysis cerebri and the pituitary body or hypophysis cerebri. The brain is covered by three membranes or *meninges*, of which the external is the *dura mater*, the middle the *arachnoid*, and the inner the *pia mater*. Most mammals have a brain like that of man, but in descending the mammalian scale the cerebrum becomes relatively smaller and has fewer if any convolutions, the corpus callosum becomes rudimentary, and the olfactory lobes enlarge (See cuts under *gyrus* and *sulcus*). In the brain of birds the hemispheres are smooth, there is no corpus callosum or pons Varolii, and the optic lobes are of immense size. There is no brain in the lowest vertebrate, *Amphioxus*. The average weight of the brain in adult males of the European type is about 1,400 grams (49.5 ounces), in women about 1,250 grams (44 ounces). The brain is in its highest activity the organ of consciousness or mind, and its general function is that of furnishing the most complex and extensive outgoing stimulation of muscles and other active tissues as a response, more or less immediate, to the most complex and extensive incoming sensory stimulation. With functions of this high degree of complexity are associated in some parts much simpler functions resembling those of the spinal cord. The cortex of the cerebral hemispheres is the portion of the brain in which the most complex coordinations seem to be effected, and which is most directly involved in mental acts. Certain parts of the cortex are, however, peculiarly related to certain special incoming or outgoing stimulations, and are called sensory or motor centers. (See *cerebral*, and *cerebral localization*, under *localization*.) The corpus striatum is usually regarded as especially concerned with stimulations passing downward, and the optic thalamus with those passing upward, among

the latter, those of sight are connected with the hinder part of the thalamus. The nates are involved in the sight function, and the testes seem to have close relations with the stimuli entering by the auditory nerve. The cerebellum is concerned with the coordination of muscular contractions in the carrying out of voluntary actions, while the medulla oblongata contains a large number of centers for comparatively simple functions, as vasomotor action, cardiac action, respiration, deglutition, etc. (See also cut under *encephalon*.) From its complexity, the brain is usually spoken of in the plural in certain relations, as, to beat out or to rack one's *brains*.

2. In entom., the principal ganglion of the nervous system, situated in the head, over the esophagus, and formed by the coalescence of several supra-esophageal ganglia. The nerves of the eyes and antennae are directly connected with it, and it gives off two inferior branches which surround the esophagus and unite beneath in the subesophageal ganglion. Sometimes this ganglion is regarded as a part of the brain, being distinguished as the *cerebrum*, while the principal or upper ganglion is called the *cerebrum*.

the medium of water. They are highly vascular, with thin walls, permitting the aeration of the blood by the oxygen in the water which comes in immediate contact with them. They are developed from different parts of the body in different classes of animals. See *gill*, and cuts under *Polyplocophora* and *Tetrabranchiata*.

2 In *Arthropoda*, as crustaceans, specifically, the externally projecting processes of the body or its limbs, which are supplied with venous blood (which is thus brought into contact with the air dissolved in water), and constitute a special respiratory organ. See cut under *Podophthalma*. Other kinds of respiratory organs in arthropods are *tracheo branchiae*, *tracheae*, and *pulmonary sacs*. See these words.

3 In *Vermes*, any appendages of the head or body so modified as to act as a respiratory organ, the various processes which protrude or radiate from the head or other region of the body, and have, or are supposed to have, a respiratory function. See cut under *Protula*.

In [*Amphionomada*, *Paracida*, and *Perbellida*] the *branchiae* are ciliated branched plumes or tufts attached to the dorsal surface of most or few of the somites. In [*Serpulidae*] they are exclusively attached to the anterior segment of the body and present the form of two large plumes, each consisting of a principal stem, with many lateral branches. Huxley, *Anat. Invert.*, p. 210.

4 In *entom.* gill-like appendages on the bodies of certain insect-larvae and pupae which live in the water, as many dragon-flies and gnats. They are expansions of the integument, and it is supposed that they absorb air from the water, and convey it by the minute ramifications of the tracheal vessels, with which they are abundantly supplied, into the main tracheae, to be distributed over the whole body. Newport.

**branchial** (brang'ki-ál), *a*. [*< NL branchialis*, *< L. branchia*, gills, see *branchiae*.] 1 Of or pertaining to the branchiae or gills, or, in animals which have no gills properly so called, of or pertaining to the parts considered homologous with gills, as, in a bird or mammal, parts of the third postoral visceral arch, or of any visceral arch behind the hyoid arch. — 2 Performed by means of branchiae as, *branchial respiration*, a *branchial function*. — **Branchial aperture**, the aperture or outlet for water which has supplied the branchiae, lying behind them. In fishes there are 2, one on each side, namely the two are confluent in a single inferior aperture. In selachians they are generally in 5 pairs, rarely in 6 or 7. In myxozoids they are usually in 7 pairs, rarely 6 or more than 7, and sometimes confluent in an inferior pair of "pores." In loriciferates they vary. — **Branchial arch**, in fishes, one of the arches of the branchial apparatus which support the branchial filaments on each side. — **Branchial bar**, the hardened portion of the branchial apparatus which supports the gills, same as *branchial arch*. — **Branchial basket**. See *basket*, 10. — **Branchial cavity**, or *branchial chamber* (a) The cavity on each side of which are the branchiae. It is behind and generally confluent with the oral cavity. (b) In *Crustacea*, a cavity or space inclosed by the branchiole tegite or gill cover (formed by a free pleural part of the carapace), and bounded internally by the pinnules of the branchiole somites. — **Branchial cleft**, one of the lateral foramina behind the head which are apparent in the embryos of vertebrates, soon disappearing in the higher types, but longer persistent (sometimes through life) in the lower, as in the amphibiae. homologous with the *branchial apertures*. — **Branchial coil**, a spirally curved tube formed by a diverticulum of the superior pharyngeal mucous membrane in certain fishes, such as the clupeids (for example, mackerels) and related forms. — **Branchial duct**, in myxozoids, a short canal (anterior) between a branchial pouch and the intestinal cavity, or one (exterior) between a pouch and the exterior of the body. — **Branchial fold**, the series of branchial filaments around the convex margin of a branchial arch. — **Branchial framework**. Same as *branchial skeleton*. — **Branchial ganglion**, a ganglion which supplies the branchiae, as in certain mollusks. — **Branchial gut**, a rudimentary branchial chamber. — **Branchial heart**, a specialized widened vascular canal which supplies the branchiae. — **Branchial lamella**, a row of branchial filaments approximated to one another and forming a lamella-like structure. In fishes there are generally two lamellae to most of the arches, surmounting their convex edges. Also called *branchial plate*. — **Branchial pharynx**, a pharynx with a branchial apparatus, as in the tunicates. — **Branchial plate**. Same as *branchial lamella*. — **Branchial pore**, a pore like branchial aperture common to all the branchial ducts of one side, such as occurs in myxozoids or loriciferates. — **Branchial pouch**, in myxozoids and selachians, a pouch like structure of the branchial apparatus in which and from which the branchiae are developed. — **Branchial ray**, in selachians, one of the cartilaginous rods radiating from a branchial arch backward, and affording support to the branchial pouches. — **Branchial respiration**, respiration by means of branchiae or gills. — **Branchial sac**, the respiratory chamber containing the branchiae in the tunicates. It is the large pharyngeal dilatation into which the oral aperture leads, and which presents the stigmata through which the cavity of the sac communicates with the exterior. See cut under *Tunicata*. — **Branchial septum**, in certain tunicates (for example, *Salpidae*), a gill detached from the wall of the branchial chamber and forming a lateral stretching from its dorsal wall to the ventral wall. — **Branchial sinus**, a vascular sinus into which blood passes from the visceral sac on its way to the branchiae. — **Branchial skeleton**, the harder framework which is subjoined to the branchiae in branchioid animals. Also called *branchial framework*. — **Branchial slit**, the space between neighboring branchial or branchial arches. — **Branchial tentacle**, in certain worms (for example, *Polychaeta*), one of the tentacle-like organs of the head, performing in part

a respiratory function. — **Branchial tuft**, in tubicolous chetopodous worms, an aggregation of contractile tentacular filaments in the cephalic region, assuming in part the office of branchiae.

In Gegenbaur's system a third prime division, *Protobranchia*, established for *Peripatus* alone, intervenes between *Branchiata* and *Tracheata*. The *Branchiata* are primarily divided into *Crustacea* proper (including the two main groups of *Entomostraca* and *Malacostraca*) and *Periopoda*, represented by *Limulus*, etc. (b) A division of vertebrates containing those which for some time or permanently breathe by gills, the amphibians and fishes, as distinguished from reptiles, birds, and mammals. synonymous with *Ichthyopoda* (which see). (c) In mollusks, same as *Branchiogasteropoda*. (e) A group of echinoderms with gills on the buccal membrane and with ambulacral plates only on the latter, including all the echinoid families except *Cidaridae*. Ludwig.

Respiration may be effected in three ways: first, the blood may be simply exposed to the water in the thin walls of the mantle cavity, as in some of the *Heteropoda*; secondly, the respiratory organs may be in the form of outward processes of the integument, exposed in tufts on the back and sides of the animal, as in the *Audubranchiata*, such as the sea slugs, etc.; and thirdly, the respiratory organs may be in the form of pectinated or plume-like branchiae, contained in a more or less complete branchial chamber formed by an inflection of the mantle as in the whelks, etc. The *Branchiogasteropoda* fall into two distinct series, the one being hermaphrodite, with the gills placed toward the rear of the body, and the other having the sexual organs in distinct individuals. The *Branchiogasteropoda* are divided into three orders: (1) *Prosobranchiata* (sexes distinct, gills usually inclosed), as whelks, etc.; (2) *Ostobranchiata* (sexes usually united in the same individual, gills often exposed), as sea slugs, etc.; (3) *Heteropoda* (free swimming gastropods), as members of the genus *Carnaria*.

[*NL*, *< Gr. βράχια*, gills, + *πνεύσας*, verbal adj. of *πνέω*, breathe.] A superfamily group of pulmonate gastropodous mollusks, by means of which such aquatic families as *Auriculidae* and *Limnæidae* are collectively distinguished from the *Helicidae*, or land-snails proper, the latter being contrasted as *Nephropneusta*. The two groups correspond respectively to the *Basommatophora* and *Stylommatophora* of some authors.

**Branchiopoda** (brang-ki-óp-ó-dá), *n pl*. [*NL*, *< Gr. βράχια*, gills, + *πούς* (*pod*) = *E foot*.] 1 In Latreille's system of classification, the first order of his *Entomostraca*, characterized as having a mouth composed of an upper lip, two mandibles, a tongue, and one or two pairs of maxillae, and the branchiae more or less anterior, so called because their branchiae or gills are situated on the feet. The order thus defined was divided into two sections: (1) *Lophypoda* (*Ceriodonta*, *Ostracoda*, and *Cladocera*), (2) *Phyllopoda* (*Ceratophthalma* and *Aspidophora*).

2 As defined by Huxley, a group of entomostracous *Crustacea*, embracing only the two groups *Phyllopoda* and *Cladocera*. It is represented by such genera as *Apus*, *Nelasma*, *Branchipus*, *Limnetis*, *Daphnia*, and their allies, which pass into one another so gradually that the groups *Phyllopoda* and *Cladocera* can hardly be established. The genera named conform to the definition of *Entomostraca* (which see) in invariably possessing more or fewer than twenty somites, and the thoracic and abdominal appendages are nearly always more or less foliaceous, resembling in many respects the anterior maxilliped of one of the higher *Crustacea*. Hence *brasc<sup>2</sup>*, *bracen*, *brassen*, etc.] 1. *n* 1 An important alloy, consisting essentially of copper and zinc. The proportion in which the two metals are combined differs considerably in different kinds of brass. Brass in general is harder than copper, and consequently wears better than that metal. It is malleable and ductile, so that it can be easily rolled into thin sheets, or be hammered into any desired shape. It turns easily in the lathe, and can be drawn into fine wire, moreover, it has an attractive golden color, and is cheaper than copper. The color of brass varies with the proportions of the ingredients. A full yellow variety contains about two parts of copper to one of zinc. This alloy was known to the ancients, and was made by them before they had any knowledge of the metal zinc as such. It is not among the metallic substances mentioned by Homer, but it was well known to Strabo, who describes the mode of manufacturing it from the zinciferous ore (calamin), and calls the alloy *orchalc* (ὀρεχαλκος). See *orchalc*, *pinchbeck*, *prince's metal*, *mosaic gold*, *Muntz's metal*, and *yellow metal*. In rhetorical comparisons, brass is a common type of hardness, durability, or obduracy.

Such *brasses* are sometimes splendidly enameled. In some examples the designs are executed in relief, or in relief in combination with engraving. Slabs of stone inlaid with figures, etc., in brass are also called *brasses*, and are a usual form of medieval monument. Both the plates of brass and the inlaid stones were frequently placed in the ordinary pavement of churches. Comparatively few of such monuments executed wholly in brass survive, as the value of the metal has caused it to be melted down and applied to other uses.

= *Syn.* 1 *Gallant*, *Valiant*, *Courageous*, *Brave*, *Heroic*, valorous, dauntless, chivalrous, doughty, resolute, manly. *Gallant*, splendid in dress or qualities, is most appropriately used with regard to courage which exhibits itself in deeds attracting attention and applause, of the first four words it is that which may have in it most of compliment and least of high commendation, but it is often a strong word, expressing splendid bravery in action as, he was a gallant officer. *Valiant* is also brave in action, especially in opposing physical force, as in battle. The word is now elevated and poetic. *Courageous* denotes the possession of that spirit which enables one fearlessly and with full presence of mind to face danger. *Brave* is the most comprehensive of the words. It may denote the possession of the highest and noblest kind of courage and fortitude, of that spirit which enables a man to bear up against evil and danger, as well as to go forth to face it. *Courageous* has much of this breadth of meaning, but is applicable rather to doing than to enduring, *brave* is both passive and active. *Heroic* combines the meaning of all the other words in the superlative degree. It indicates a lofty superiority to fear, a noble self-forgetfulness, an almost superhuman power to dare, achieve, or suffer. It bears the same relation to the other words that *sublime* bears to *great*, *grand*, or *lofty*.

**II** *n* [*< F brilliant*, a diamond] **1** The form in which the diamond and other precious stones are cut when intended to be used as ornaments, whenever the shape and cleavage of the uncut stone allow this to be done without too much loss of material. The brilliant is susceptible of many small modifications as regards the size, proportions and even the number of the facets, but in the most perfect cut there are 58 facets. The general shape of all brilliants is that of two pyramids united at their bases, the upper one being so truncated as to give a large plane

and is formed by removing one third of the thickness of the stone, the opposite small end, called the *culet* or *coilet*, is formed by removing one eighth of the thickness of the stone. The *girdle* is the widest part, and forms the junction line between the upper part, called the *crown*, and the lower part called the *pavilion*. Fig 2 shows the top (a), side (b) and back (c) views of a modern brilliant cut with 58 facets. T is the table, C, the culet, G, the girdle. A, the temples or bezels (of which there are 4 in all), B, the upper quoin or bezels (of which there are 4), S, star facets (of which there are 8 in the crown), E, skill or half facets (8 in the crown and the same number in the pavilion), D, cross or skew facets (8 in each part), P, pavilion facets (4 in number), Q, lower or under side quoin (of which there are 4) — making 58 facets in all. Sometimes extra facets are cut around the culet, making 66 in all. In fig 3 a and b show top and side views of the single cut, or half brilliant, c is a top view of the old English single cut. In fig 4, a, b, and c show top, side, and back views of a brilliant with 42 facets. In fig 5, a, b, and c show top, side, and back views of the split or double brilliant, with 74 facets. In fig 6, a, b, and c show top, side, and back views of the Portuguese cut, which has two rows of rhomboidal and three rows of triangular facets above and below the girdle. In fig 7, a, gives a side view of the double rose sometimes called the *brilliant* when several more rows of triangular facets are added. Fig 8 shows

the form and size of the famous Regent diamond, belonging to the government of France. It weighs 130 1/2 carats, and is generally considered the most valuable diamond known, having been estimated by experts at twelve million francs. It comes very near being a perfect brilliant in form but is a little too thick or deep for its breadth, while the Koh-i-noor, as cut since it came into the possession of the Queen of England, is too thin or spread. Any gem may be cut in brilliant form, but when the word *brilliant* is used by itself, it is always understood to mean a diamond

An alloy of which copper forms the predominating portion, and into the composition of which tin almost always enters, but the name is also given to alloys containing no tin. The proportion of copper in various bronzes is usually between 80 and 90 per cent. in some it falls as low as 70. The proportion of tin in the bronzes of different ages and those used for various purposes is almost as variable as that of copper. Bronze used for bells has the largest amount of tin. In some it reaches 25 per cent. The bronze formerly used for cannon contained about 10 per cent. of tin and often a small amount of zinc. Statuary bronze is, and has been from the beginning of its use for the purpose of very variable composition. In some statuary called bronze there is less than 1 per cent. of the white zinc is present in sufficient quantity almost to justify calling the material brass. The zinc in various pieces of statuary cast within the past two or three hundred years, and erected in some of the principal cities of Europe, varies in quantity from less than 1 per cent. to 25. Lead is present in many bronzes, but usually in small amount, rarely being as much as 3 per cent. Bronze is an alloy of importance to both the arts and commerce and holds of great historical interest, since it has been known from remote ages over a large part of the world. It is preferred to simple unalloyed copper, on account both of its color and of its greater durability. Among prehistoric races the use of bronze preceded that of iron, and among them remains are found swords, axes and other cutting instruments of this material, some times artistically made and ornamented, as well as domestic implements and utensils of many kinds. The ancient Greeks, Romans, etc., made statuary of it in enormous quantities and also coins, recording tablets and a great variety of articles of common use. It is now not only used for cannon (for which purpose it has been to a great extent supplanted by steel), bells, and statuary, but also for parts of various machines, especially bearings, and for screw propellers. The beauty and durability of bronze statuary depend in no small degree on the color and composition of the oxidized film or incrustation which forms upon it when it is exposed to the weather. This is called its *patina* (which see). In recent times numerous experiments have been made with a view to improve the quality of bronze in various ways, in particular by the addition of small quantities of other substances, especially metals. The most important result of these experiments seems to be *phosphor bronze*, an alloy patented by two Belgian metalurgists about 1870, and now extensively used where toughness and resistance to wear are required. The amount of phosphorus in phosphor bronze is less than 1 per cent., and the effect it produces is probably due to its reducing action on the oxides of the other metals during the process of manufacture. Phosphor bronze is of finer grain and color, and is believed to be much more durable than ordinary bronze, and it is thought by many that it will eventually be proved to be the best material for artillery. Extensive experiments have also been made with manganese, lead, and other metals. *Aluminum bronze* is an alloy of copper and aluminum now in use, especially where a great strength is required. So called *steel bronze* is bronze hardened by mechanical compression. It has not come into general use, but was introduced by its inventor to be used for cannon. See *aluminum*.

On one side of the seal is the name of the pope, and on the other are the heads of St Peter and St Paul Bulls are written in Latin, either in the ordinary cursive hand or in round Gothic characters, and have a red seal on the parchment itself, in which the name of the pope encircles the heads of the apostles. They begin with the name of the pope followed by the term *episcopus* (bishop) and the words *servus servorum Dei* (servant of the servants of God) and a salutation, and close with the place and date of execution and the subscription of the chancellor or other functionary of the papal chancery. The distinctive name of a bull is taken from the first word or words of the general introduction which follows the salutation as, the bull *Unigenitus*, which begins with the words *Unigenitus Dei*, etc., issued in 1713 by Clement XI, condemning the Jansenist propositions set forth in Quenot's "Moral Reflections."

A *brief*, though of equal authority with a *bull*, differs from it in several important points, chiefly of form. It is shorter, relates to subjects of inferior importance, is written in Latin in ordinary Roman letters and on the smooth side of the parchment, uses the word *papa* instead of *episcopus* in the introductory formula, is sealed with red wax instead of lead, and with the pope's private seal, the fisherman's ring, and is never signed by the pope himself, but by a secretary of the papal chancery. Both *briefs* and *bulls* belong to a class of papal documents generally called *apostolic letters*, these are *encyclical* when addressed to the bishops of the Roman Catholic world, and from their contents are called *constitutions*, *decrees* (ancient), *synodal letters* (also ancient), *rescripts*, *motus proprii*, etc. *Consistorial bulls* are issued after consultation with the consistory of cardinals, and are signed by all the cardinals consulted.

Specifically — 2 A small metallic projectile intended to be discharged from a firearm commonly limited to leaden projectiles for small arms

Bullets were formerly always spherical in form, but many changes have been made in them in both shape and structure. The bullet used for rifles of recent construction is elongated and conical, or rather oval at the apex somewhat like half an egg drawn out with a hollow at the base, into which a plug of wood or clay is inserted, and with small cuts (canals) in the metal outside, which are filled with beeswax to lubricate the barrel while the bullet is passing through it. When the gun is fired the plug is driven forward to the head of the cavity, forcing the base of the bullet outward till the lead completely fills the grooves in the rifled barrel. The plug is often omitted, the base of the bullet being forced into the grooves by the expansive force of the powder

Buoys are of various

shapes and kinds, according to the purposes they are intended to serve as, *can-buoys*, made of sheet-iron in the form of the frustum of a cone, *spar buoys*, made of a spar, which is anchored by one end, *bell buoys*, surmounted by a bell, which is made to sound by the action of the waves,

1 Whistling buoy 2 Can buoy 3 Spar buoy 4 United States life buoy

*whistling buoy*, fitted with an apparatus by which air compressed by the movement of the waves is made to escape through a whistle, and thus indicate the situation of the buoy, etc. In the waters of the United States the following system of placing buoys as aids to navigation is prescribed by law. Red buoys mark the starboard or right hand side of the channel coming from seaward, and black the port or left hand side, mid channel dangers and obstructions are marked with buoys having black and red transverse stripes, and mid channel buoys marking the fair way have longitudinal black and white stripes, buoys marking sunken wrecks are painted green. The starboard and port buoys are numbered from the seaward end of the channel, the black bearing the odd and the red the even numbers. 2 A buoyant object designed to be thrown from a vessel to assist a person who has fallen into the water to keep himself afloat; a life-buoy. The life buoy now in common use in the United States navy consists of two hollow copper vessels, connected by a framework and having between them an up right pole, weighted at the bottom and surmounted by a brass box containing a port fire. This machine is hung over the stern of the vessel, and can be dropped by means of a trigger. At night the burning of the port fire serves to point out its position. See also *cut under breeches-buoy*—*To bleed a buoy* See *bleed*—*To stream a buoy*, to let it drop from the vessel into the water before the anchor is dropped

**Burden of proof**, in law the obligation resting upon one of the parties to an action to establish an alleged fact by proof, under penalty of having judgment given against him, according to the presumption recognized by the law of evidence in case he adduces no proof. The burden of proof is said to be shifted when the party upon whom it lay has produced sufficient evidence to turn the presumption in his favor. Two circumstances are essential to the existence of a burden of proof: first, there must be a question of fact between two parties before a tribunal which will render a decision whether there is any particular evidence or not, and second, this decision must be governed by rules of presumption, more or less artificially extended so as to lead to a determinate result in every case. In forensic controversy there will or will not be a burden of proof, according as these conditions are or are not fulfilled. In reasonings as contradistinguished from disputations, if they relate to policy, there is nothing to which the term *burden of proof* is applicable: for the decision will be based on considerations of likelihood, economy, safety, etc., but never on formal rules of presumption. A general habit may be followed when decided reasons fail, in questions both of policy and of morals: but the phrase *burden of proof* is not employed in such cases. A speculative or scientific inquiry, on the other hand, cannot be closed until satisfactory evidence has been obtained or curiosity dies out, so that the term *burden of proof* has no meaning in such a connection. Yet an individual reasoner who being impatient of doubt insists on adopting an answer to each question, however blank our ignorance of the facts must often resort to a merely formal presumption: and such persons say that there is a burden of proof upon any possible advocate of the hypothesis which they propose to reject without proof. The term is also used in cases where the absence of observations of a certain kind is itself a significant fact. Thus, we may say that there is a burden of proof upon the evolutionists to explain our not finding forms intermediate between recognized types, that is to say, the non-occurrence of such observations is a fact to be taken into account. — *Syn* Weight, incumbrance, clog, incubus, drag, freight loading, cargo.

A dry measure, containing 8 gallons or 4 pecks. The imperial bushel legally established in Great Britain in 1824 has a capacity of 2,218 192 cubic inches, and holds 80 pounds avoirdupois of distilled water at the temperature of 62° F. with the barometer at 30 inches. Previous to this the Winchester bushel had been the standard measure from Anglo-Saxon times, its capacity was 2,150 42 cubic inches. The measures of capacity of the United States are founded on the Winchester bushel, the imperial system having been created since the separation of the two countries. The name *Winchester bushel* is derived from the fact that the ancient standard bushel measure of England was preserved in the town hall of Winchester. Numerous bushels were in use in England at the time of the adoption of the imperial system. Thus, by a statute of Anne, a bushel of coals is to contain a Winchester bushel and a quart of water, to be 19½ inches in diameter, and to be heaped in the form of a cone 6 inches high. Various equivalent weights of different commodities had also been made bushels by law. Many of the American States have established equivalent weights, which vary considerably in different States. To the last two constructions, respectively, belong the idioms "I cannot *but* hope that, etc." and "I can *but* hope that, etc." The former has suffered ellipsis of the principal verb in the first clause "I cannot do anything but hope, or 'anything else than hope, or 'otherwise than hope," etc., implying constraint, in that there is an alternative which one is mentally unable or reluctant to accept, *but* being equivalent to *otherwise than*. The latter, "I can *but* hope that, etc." has suffered further ellipsis of the negative, and, though historically the same as the former, is idiomatically different. "I can only hope that, etc., implying restraint, in that there is no alternative or opportunity of action, *but* being equivalent to *only*, not *otherwise than*, or *no more than*

— 3 A measure of wine equal to 126 United States (that is, old wine) gallons, a pipe It is no longer a legal measure in Great Britain, and the common statement that an imperial butt is 126 imperial gallons is incorrect, the butt is 110 imperial gallons The measure was originally used chiefly for Spanish wine, and the word was used to translate Spanish *bota*, which equaled 126 United States gallons, and to distinguish that from the Spanish *pipa*, which contained only 114 United States gallons Its present value was legalized by a statute of Anno It is now confounded with the *pipe* The pipe of Madeira is reputed to contain 110 gallons, of Canary, 120, of Port, 138, of Marsala, 112 The *bota* and *pipa*, throughout Spain, vary but little from the values above given In Portuguese countries two measures are common, one of 141 gallons (Oporto, Lisbon for oil), and another of 110 gallons (Lisbon, Madeira, Porto Rico, Bahia). There is besides a Portuguese pipe of 132 gallons (Lisbon for oil Bahia). In Italy the name *botte* is applied to a cask holding 200 United States gallons or more, but it was in many places confounded with the *pipa*, which held only 160 to 170 gallons The French word *boute* was never used as the name of a wine measure, neither was the German *butte* or *butte* In Denmark there was a *bottle* of 123 United States gallons In Gotha, a measure of the same name equal to 115 United States gallons The *bottle* of Bolivia is only 93 United States gallons A butt of London beer, at the time when London beer was measured differently from ale, was 3 hogsheads A butt of salmon, by a statute of Henry VI, was 84 gallons

Other prominent lofty peaks in California are still called *buttes*, as Downville Butte, Marysville Butte, etc. This use of the word *butte*, now gradually disappearing from the region in question, is a relic of French occupancy of the Northwest, and of the subsequent wide distribution through that region of the Hudson's Bay Company's employees, most of whom were of French extraction. The word was picked up by overland emigrants and carried to the farthest West, and it has been much used as a place name, alone or in combination.

It is used as a food or relish by most peoples, and is made directly from the milk, or from the cream previously separated from the milk, of cows, goats, and other animals. Agitation or churning separates the fats from the milk or cream and makes them cohere in lumps, which are then worked together, freed as far as possible from buttermilk, and usually mixed with salt, which preserves the butter and develops its flavor.

A Pertaining to Byzantium, or Constantinople, an ancient city of Thrace, situated on the Bosphorus, which became the capital of the Byzantine or Eastern empire, or to the empire itself. Byzantium was founded by a Greek colony in the seventh century B. C., but was of no great importance until A. D. 330, when the emperor Constantine the Great made it his capital, and changed its name to Constantinople, after himself. **Byzantine architecture**, a style of architecture developed from the classical under the Byzantine empire during the fourth and fifth centuries A. that empire by the Turks in A. D. 1453. It spread so widely that its influence even in Italy did not wholly decline before the fifteenth century, and it may be considered as surviving still in Russian architecture, and in a less marked degree in other eastern lands. An almost universal feature of the style, in buildings of any pretension, is the construction of brick or rough stonework with more precious materials, large spaces are left void of bold architectural features, to be rendered in trestling merely by surface ornament of polished marbles presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline. The style depends much on color for its effect, and mosaics wrought on grounds of gold or of positive color are profusely introduced. The leading forms which characterize the Byzantine style are the round arch, the circle, the cross, and the dome supported upon pendentives.

The capitals of the pillars are of endless variety, and full of invention. While some are plainly founded on the Greek Corinthian, many resemble those of early round arched western architecture, and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilica of St. Sophia, in Constantinople and the church of St. Mark, in Venice, are classical examples of Byzantine architecture. — **Byzantine historians**, a series of historians and chroniclers of the affairs of the Byzantine empire, scattered through the whole period of its existence. They are our only source of knowledge of Byzantine history. Their works have been several times printed complete in the original Greek, the latest edition being by Niebuhr and others, in 48 volumes.

Hence **cabāl**! ] 1 The theosophy or mystic philosophy of the Hebrew religion, which grew up mainly after the beginning of the tenth century, and flourished for many generations. The cabala employed itself first in a mystic explanation of Deity and cosmogony, and in the creation of hidden meanings for the sacred Hebrew writings, thus drawing into its province all the Hebrew law and philosophy. Later cabalists pretended to find wonderful meanings even in the

letters and forms of the sacred texts, and made for themselves elaborate rules of interpretation.

The cardinal doctrines of the cabalists embrace the nature of the Supreme Being, the Divine emanations or Sephiroth, the cosmogony, the creation of man, psychology, the destiny of man and the universe, and the import of the revealed law. The cabalists seem to have endeavored to identify all such sciences as demonology, astrology, chiromancy, sympathetic medicine, etc., with their theosophic mysticism, weaving the whole into a secret universal wisdom or esoteric philosophy of the universe. They sympathized with many points of Christianity so that in the fifteenth and sixteenth centuries the cabala was by many thought highly important as a proof of Christianity and as a means of converting the Jews.

Hence—4. An executive council, the select council of a sovereign or of an executive government; the collective body of ministers who direct the government of a nation or country.

In Great Britain, though the executive government is vested nominally in the crown it is practically in a committee of ministers called the *cabinet*, which is of comparatively modern development. Every *cabinet* includes the First Lord of the Treasury, who is generally chief of the ministry, or prime minister, the Lord High Chancellor, the Lord President of the Council, the Chancellor of the Exchequer, and the five Secretaries of State with two or more other members, at the prime minister's discretion. In the United States the *cabinet* is a collective popular name, not recognized by law, for the heads of the eight executive departments, namely, the Secretaries of State the Treasury,

War, the Navy, the Interior, and Agriculture, the Postmaster General, and the Attorney-General. They are appointed by the President, by and with the advice and consent of the Senate, and are removable at the President's pleasure. They have as a body no legal functions, but by custom meet the President at stated times for consultation.
